Operating Instructions
Frequency Converter for Vibratory Feeders
Type FR 13 / FR16
Technical safety instructions for the user

This description contains the necessary information for the correct application of the product described below. It is intended for use by technically qualified personal.

Qualified personnel are persons who, because of their training, experience and position as well as their knowledge of appropriate standards, regulations, health and safety requirements and working conditions, are authorised to be responsible for the safety of the equipment, at all times, whilst carrying out their normal duties and are therefore aware of, and can report, possible hazards (Definition of qualified employees according to IEC 364)

Safety Instructions

The following instructions are provided for the personal safety of operators and also for the protection of the described product and connected equipment.

Warning!

Hazardous Voltage
Failure to observe can kill, cause serious injury or damage

- Isolate from mains before installation or dismantling work, as well as for fuse changes or post installation modifications.
- Observe the prescribed accident prevention and safety rules for the specific application.
- Before putting into operation check if the rated voltage for the unit conforms with the local supply voltage.
- Emergency stop devices must be provided for all applications. Operation of the emergency stop must inhibit any further uncontrolled operation.
- The electrical connecting terminals must be covered!
- Earth bonding must be tested for integrity after installation.

Specified Use

The units described herein are electrical controllers for installation in industrial plant. They are designed for controlling vibratory feeders.

1.0 General
The REOVIB MFS 168 range comprises special, adaptable controllers for use with vibratory feeders. The units generate an output frequency, to drive feeders, that is independent of mains frequency and so exact tuning with springs is not necessary. The feeders also run quieter because of the sinusoidal output signal. The adjusted output frequency corresponds to the mechanical vibrating frequency of the feed system. In operating mode the feeder remains constant at the set frequency. The feeder throughput is determined by the output voltage level.

Notable Features:
- Adjustable output frequency, independent of mains frequency
- Adjustable minimum and maximum limits for the frequency range
- Adjustable current limit for the maximum coil current
- Constant feeder throughput irrespective of mains fluctuations
- On/Off status relay
- Track control
- 24 VDC output for operating a solenoid e.g air valve
- Four user setting memory locations

2.0 Function
The unit is set up by using the touch panel on the front plate (buttons and LED display). All settings can be made by using the touch panel and a series of menus. The various parameters can be selected by entering operator codes. A fuller description of the parameters can be found in the section on settings. Alternatively, the feeder throughput can adjusted by using an external potentiometer, an external voltage signal 0...10 V, DC or a current signal 0(4)...20 mA (the chosen option must be selected in menu 003). A relay with potential free contacts is provided for feeder status indication and this operates in conjunction with the feeder enable signal.

During normal operation the set point is displayed as a percentage in the LED window. In the programming mode the selected dimension, as described in the setting up instructions, is shown. Changed settings can be stored by leaving the programming mode or automatically saved by not pressing a key for a period of 100 seconds.

The control units can provide a frequency range from 5…150Hz, which can be limited by adjustable, upper and lower frequency limits. The usable adjustment range cannot exceed a ratio of 1:4, i.e. the upper frequency limit cannot be more than four times the lower frequency limit. It is possible to have a narrower setting of the limits and this provides a margin of safety against too wide a difference in the vibrating frequency.

The maximum output current drawn by the coil can be determined by integrated current limiting. Critical parameters such as the current limit and vibrating frequency range are held under a special service menu. This menu cannot be accessed through the normal menu structure and an additional code number must be used to gain access. This prevents unauthorised adjustment of these sensitive parameters.
2.1 Track control

The output can be switched ON and OFF from a track component sensor, using internal, adjustable time delays (ton and toff). The queue of components rises above and drops below the track sensor position. The controller output switches on when the sensor cannot detect product and a switch-on time delay has elapsed. The output is switched off when product is detected and a switch-off time delay has elapsed (FULL displayed in the LED window). Gaps in the product feed cause resetting of the time delay. The time will always be precise from the last or first component, respectively. The ON and OFF time delays are set in the programming menu. The first decimal point in the display blinks to indicate that an internal timer is running.

With activating the feeder, another time-level “sensor time out” will be started. This time-level will give a fault message over the output ST6 after an adjustable time “t fault (1…240sec)” has elapsed, if during this time period no product has been detected by the sensor.

As an option, it is possible to also switch the feeder off. In this case the display will show “ERROR SE” alternately. This switch-off function must be selected in the menu “C15” with “E:E:” = I (ERROR reset by 0/I-button or enable on/off).

2.2 Operating with two speeds (2 set points for coarse/fine switching)

Coarse/Fine control can be used instead of track control (Menu C 003). The second set point is activated through the same sensor input that is used for track control. Either contacts or a 24 VDC signal can be used to change the set point from coarse to fine. The second set point is activated, immediately, by applying a 24 V signal (The track control function is invalid)

2.3 Control inputs and output

<table>
<thead>
<tr>
<th>Enable input:</th>
<th>External switch or 24 VDC signal voltage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Output Sensor time out:</td>
<td>Internal contact</td>
</tr>
<tr>
<td>Sensor input for track control:</td>
<td>24 V, DC (PNP)</td>
</tr>
<tr>
<td>Output status relay</td>
<td>Status-Relay contact 250 V/1 A (changeover). Relay closes when the feeder is running – the relay opens when there is no enable signal or a fault displayed.</td>
</tr>
<tr>
<td>Air valve output:</td>
<td>230 V, AC (Main voltage)</td>
</tr>
<tr>
<td>Output for air blast, comes on with feeder and switches off, 0 - 60 sec., after feeder stops</td>
<td></td>
</tr>
</tbody>
</table>
2.3.1 Enable input

In the standard settings the enable input is inverted. It means the controller is running without an external enable signal. For using the enable input the parameter “-En.” in menu “C 003” must be set to “0”

2.4 Display

- **Normal Mode:** The throughput set point is displayed
- **STOP** Output switched off using the `0` button
- **OFF** Unit inhibited by the enable input
- **FULL** Output switched off by the track control sensor

3.0 Construction

The units are available as stand-alone enclosed versions.

3.1 Enclosed units

- Mains switch
- Touch panel with display
- Mains cable with plug
- Output socket for connecting to the feed system
- Sensor socket. The standard unit has provision for 24 VDC sensors with a PNP output
- Control socket for enable signal
- Control socket for status relais
- Control socket for sensor time out
- Control socket for Air valve

</tbody>
</table>

* The units are provided with switch-on, current damping. However it is still possible that some internal capacitor, energising, current spikes will be generated, especially when several units are switched on simultaneously. Therefore, fuses and overload trips should have anti current surge characteristics.

6.0 Declaration of Conformity

We declare that these products conform with the following standards: EN 50081-2 and EN 50082-2 in accordance with the regulations of guidelines 89/336/EWG.

REO ELEKTRONIK GMBH, D-42657 Solingen
### 7.0 Settings

After checking the correct operation of the controller in conjunction with the vibratory feed system, it is advisable to restrict the user to feeder throughput settings only.

Setting the feeder throughput:
Press the P key twice and adjust the throughput with the cursor keys (Code C. 000).

<table>
<thead>

8.0 Control elements

8.1 Settings

The six buttons and a LED display found in the front panel, are used for operating and setting up the unit. All operating methods and adjustable parameters can be set up through this panel. The “I” and “O” buttons are used for switching the unit ON and OFF, however, these do not provide mains isolation, they simply inhibit the power semiconductors.

The “P”, “F” and “Cursor Buttons” are used for parameter adjustment. Parameters are set by using menu controls which are called up by entering operator codes. The functions are described in greater detail in the section on setting instructions.

The display value can be increased or decreased by units, or tenths of units, by a short press of the cursor buttons. Holding the buttons down will cause the display to change in units of ten.

To prevent accidental or unauthorized adjustment the adjustment parameters, in the user menus, are protected. A code must be entered to open the user menus. There are different pass codes for each function group.

Setting adjustments are automatically saved upon leaving the programming mode or if no button is pressed for a period of 100 seconds.

All setting routines are commenced by pressing the programming button “P”. The following diagram should clarify the sequence in which keys are pressed:

1. Press the “P” key.
2. Select the code number with the cursor keys.
3. Press the “P” key. This displays the first menu point. The required menu point can be found by repeatedly pressing the “P” key (scrolling).
4. The value in the menu point can be changed with the cursor keys.
5. Scroll to the next menu point or to the end of the menu, which returns the display to the set point value, by pressing the “P” key. To exit the menu and return back to the normal display, quickly depress the “P” key for 5 seconds.
6. To return back to the previous position in the menu, press the “F” key.
9.0 Commissioning

9.1 Preliminary steps

- Check that the unit is correct for the local mains supply (rating plate information) and that it is correctly rated for the feed system.
- Connect the controller according to the connection diagram

Important points

Using the control units described in this document, it is possible to adjust the feed system so that it runs at resonance. In this condition it is possible to obtain excessive output for a very low set point setting. Therefore extreme care should be taken to avoid causing damage to the drive coil, through hammering.

In practice it is not possible to run at resonant frequency without accelerometer feedback because the system would be unstable and uncontrollable. The system must be set safely off resonance i.e. either above or below the natural frequency.

Resonant frequency: Depending on the spring and mass design of the feeder system it is possible to have resonance at more than one frequency. These additional resonance points are multiples of the main frequency. For this reason in critical situations it is possible that the automatic frequency search will not find true resonance and in such cases the natural frequency must be determined manually.

9.1.1 Operating frequency of the feeder coil

It is possible that the current flowing through the coil will increase for a small frequency adjustment. and so this should be checked with a true RMS instrument for each new application as well as monitoring the coil for heat build-up.

The coil should be designed for the correct operating frequency to prevent excessive current draw and the consequential overloading of the coil.

9.1.2 Measurement of the output voltage and current

The voltage and current cannot be measured with a regular instrument because the controller output uses an electronic inverter with a pulse width modulation signal. An effective measuring instrument such as a moving iron meter (analog) must be used. It is recommended that an analog instrument is used rather than an electronic multi-meter which will give a misleading reading.
9.2 Putting the equipment into operation

1. Establish the vibrating frequency.
2. Establish the power of the feed system (maximum permissible current draw).

For a new feeder where settings are unknown: (see also comments below)

**Without connecting the feeder**, select parameter FAC in menu C210 (reset factory settings), press the cursor key to reset (SAFE) and press the P key to leave the menu. The factory settings are listed in the table in section 7, headed settings

*Comments*

It is possible that a special parameter set, for a machine manufacturer, has been pre-stored under a user code and these can be recalled. In such instances specific machine settings will be loaded and so the next steps are not relevant.

Basic settings:

- Connect feeder.
- Set frequency (refer to feeder data sheet). Menu C096 parameter F.
- Check current limit (refer to feeder data sheet). Menu C040 parameter I (shows the current limit as a percentage of maximum). If applicable use service menu for setting.
- Increase set point, observe feeder, check running.
- Increase set point to maximum and check if power needs limiting (hammering). If necessary adjust the limit as follows:-
  - Adjust set point to zero
  - Set parameter P (maximum limit) in Menu C096 to 50
  - Adjust set point A to 100%.
  - Increase the maximum limit P from 50% until the required amplitude is reached.
  - The full set point range of 0…100% can now be used.

Additional settings e.g. soft start, time delays etc. can be set to suit the particular equipment.

**Determining the output frequency (vibrating frequency)**

It is essential that the output frequency is adjusted with the set point set at a low frequency, otherwise on hitting the resonant frequency it is possible to achieve a high amplitude with a low output voltage. An analog, effective value, current indicating unit (moving iron meter) must be connected into the output circuit. **Resonant is reached when there is a maximum amplitude for a minimum output current.**

To achieve a stable feed system there must be an offset between the vibrating frequency and resonance (approx. 1…2Hz). This offset must be determined by the user because different feeders have different running characteristics.
## 10.0 Setting Instructions

### 10.1 User adjustment of throughput

#### Code C. 000

- **Feeder amplitude set point**
  - 0...100 %

- **Running mode**

A further set point code can be found under C002 (for use in coarse/fine operation)

#### Code C. 000

- **Feeder amplitude set point**
  - 0...100 %

- **2nd Feeder amplitude set point**
  - 0...100 %
  - (only if “SP.2. = I”)

- **Running mode**

## 10.2 Tuning the feed system

### 10.2.1 Feeder settings

#### Code C. 020, 096

- **Feeder amplitude set point**
  - 0...100 %

- **Max. output**
  - 100...5 %

- **Vibration frequency [Hz]**

- **Soft start 0...5 Sek.**

- **Soft stop 0...5 Sek.**

- **Running mode**
10.2.2 Track control

Code C. 007, 167

- On time delay 0...5 sec.
- Off time delay 0...5 sec.
- Invert sensor
- I = Invert
- Running mode

10.2.3 Time out and follow-up time

Code C 015

- 0 = Sensor time out not active
- I = Sensor time out active
- E. = Sensor time out [sec.]
- Ai. = Follow-up time valve output
- 0...60 sec.
- Running mode

10.2.4 Set point source

Code C. 003

- 0 = Set point using display
- I = External set point
- 0 = External set point 0...+10 V
- I = External set point 4...20 mA
- 0 = 0...10 V/ 0(4)...20 mA
- I = Potentiometer
- 0 = Level sensor control
- I = 2nd set point active
- 0 = Enable
- I = Invert Enable
- Running mode
10.2.5 Save selected parameters

Code C. 143

Choose user parameter set  
Save new parameters  
Running mode

10.2.6 Recall user and factory settings

Code C. 210

Return to factory settings  
Choose user parameter set  
Return to user settings  
Running mode

10.2.7 Hide parameter menus

Code C. 117

I = Hide menus  
Running mode

10.2.8 Hide set point

Code C. 137

0 = Access set point off  
I = Access set point on  
Running mode

This parameter disabled only the set point access. For disable all parameters use also code C. 117
10.2.9 ERROR Reset

In the event of an error check that this is not caused by incorrect wiring or cable faults. The error message, ERROR ACC, can also occur if regulation mode is chosen (in Menu C008) and an accelerometer is not connected, for example.

Reset the error in the following manner:-

Clear Error

Clear Error and set point to "0"

11.0 Error messages / ERROR reset

Errors are indicated by an alternating code and ERROR display

**Overload limit**
Output level exceeded e.g. incorrect frequency setting, coil air-gap to wide.

**Short circuit trip**
Faulty coil, short circuit or defective cable..

**Over voltage**
Supply voltage too high or back EMF from the coil at lower frequencies.

**Current spike limit**
Frequency set too low for installed coil or frequency altered too rapidly during setting up.

**ERROR Reset through Menu C009**

**Sensor time out**
After sensor time out has elapsed

ERROR Reset is achieved by pressing touch panel keys 0 or 1 during normal operation or by using Menu C009.
12.0 Connections

Use screened cable!

13.0 Dimensions

All dimensions in [mm]
A 1.0 Service appendix

ATTENTION!
The settings described in this section relating to the service menu are intended for use by skilled persons because the functions and limits of the feed system can be greatly influenced by their adjustment.
It is the responsibility of the supplier of the equipment to decide whether this information should be released or restricted for use by service engineers only.
The service menu cannot be accessed through the normal menu structure. It can only be enabled by using a special key code.

A 1.1 Service Menu

The critical parameters, current limit and user adjustable frequency range are held in a separate service menu. This menu cannot be reached through the normal menu structure and must be enabled by using an additional code number. This prevents the unauthorised changing of these sensitive parameters.

- **Current Limit** – Protects the coil against overload.
  The output current limit is set to the maximum current rating of the coil.
- **Frequency limits** – Protection against unhealthy operation.
  The vibrating frequency limits available to the user are fixed.
- **Output voltage limit 110 V**
  The output voltage limit allows 110v coils to be used on a 230V supply without damage.

A 1.2 Frequency adjustment range
The control unit is supplied with a maximum frequency range of 5…150Hz. Using an adjustable under and over frequency limits, the user range (parameter F) can be restricted to a maximum ratio of 1:4.

A practical setting is +/- 20 % of resonance.

Usable frequency range
Parameter "F"
Menü "C 008", "C 096", C "020"

1. Set lower frequency limit.
2. Set upper frequency limit.

A 1.3 Current limiting
The current limit is used to set the controller for the rated current of the coil \( I_M \). The current limit \( I_{MAX} \) is set by using parameter \( I \). The displayed setting is expressed as a percentage of the controllers rated current \( I_N \) (100 % corresponds to the units rated current).

\[
I_{MAX} = \frac{I_M \cdot 100}{I_N}
\]

To protect the coils the current limit must be set to the rated current for the coil(s) \( I_M \).

When several coils are connected in parallel the coil current is the sum of all individual currents.
Enable Service Mode

The actual service menu is accessed by opening the service mode.

The normal service menu, containing the output current and frequency limit settings, is accessed by opening the service mode.

Servicemenu

Code 040

After making adjustments the service mode must be closed again!
